

Guide to 003_Bluetooth Keyboard

(Turn on by connecting the device to power via the USB connector on the side)

Connect device (laptop, smartphone, ...) as a normal keyboard

1. Under bluetooth settings, search for new devices and connect to "Elsass Keyboard" (Elsass Bluetooth" for old version).
2. By pressing 0/1 switches connected to the 8 channels, the unit will send the preset keys to the receiver.

Change the keyboard setup

The reprogramming of the individual switches is done via Wifi and can be changed from another device than the one connected via Bluetooth.

1. On a device (laptop, smartphone, ...) search for wireless networks. Connect to "Elsass Keyboard" or whatever the device has been renamed to, as this can also be changed.
 - a. For some devices, it may be necessary to accept the connection to the network.
2. Open any browser (Chrome, Edge, Firefox, ...) and type 192.168.1.1 in the address field.
3. By changing the list for the 8 channels and then pressing "Submit" you can specify what the 8 channels activate.
 - a. If you are sitting on a PC with English language, you can select "En" at the top.
4. (Requires update to the latest version!): If you want to change the name for Wifi and/or Bluetooth, this is also done via the corresponding boxes - however, this requires the device to be restarted, by briefly disconnecting the USB plug and then reconnecting the USB.
